

Experiment 22 :

Create a Python program that performs reference resolution within a text.

Code:

```
references = {  
    "he": "John",  
    "she": "Mary",  
    "his": "John's",  
    "her": "Mary's"  
}  
  
sentence = input("Enter sentence: ")  
words = sentence.split()  
resolved = []  
  
for word in words:  
    resolved.append(references.get(word.lower(), word))  
  
print("Resolved Sentence:")  
print(" ".join(resolved))
```

Output

```
references = {  
    "he": "John",  
    "she": "Mary",  
    "his": "John's",  
    "her": "Mary's"  
}  
  
sentence = input("Enter sentence: ")  
words = sentence.split()  
resolved = []  
  
for word in words:  
    resolved.append(references.get(word.lower(), word))  
  
print("Resolved Sentence:")  
print(" ".join(resolved))
```

... Enter sentence: He is reading his book.
Resolved Sentence:
John is reading John's book.

The screenshot shows a terminal window with a dark background. The Python code is displayed in a light blue font. The user input "He is reading his book." is shown in green. The output "John is reading John's book." is shown in green. The terminal window has a title bar with "Terminal" and "Python 3". The system tray at the bottom shows the time as 2:02 PM and the date as 28-07-2026.
