

Experiment 10 :

Implement transformation-based tagging using a set of transformation rules. Apply a simple rule to tag words using Python.

Code:

```
# Initial tagged sentence
tagged_sentence = [
    ("The", "DT"),
    ("boy", "NN"),
    ("is", "NN"),
    ("playing", "NN")
]

print("Before Transformation:")
for word, tag in tagged_sentence:
    print(word, ":", tag)

print("\nAfter Transformation:")
new_tags = []
for word, tag in tagged_sentence:
    if word == "is":
        tag = "VBZ"
    elif word.endswith("ing"):
        tag = "VBG"
    new_tags.append((word, tag))

for word, tag in new_tags:
    print(word, ":", tag)
```

Output

```
[12] ✓ 0s
new_tags = []

for word, tag in tagged_sentence:

    if word == "is":
        tag = "VBZ"

    elif word.endswith("ing"):
        tag = "VBG"

    new_tags.append((word, tag))

for word, tag in new_tags:
    print(word, ":", tag)

... Before Transformation:
The : DT
boy : NN
is : NN
playing : NN

After Transformation:
The : DT
boy : NN
is : VBZ
playing : VBG
```
