

Experiment 6 :

Implement a basic N-gram model for text generation. Generate text using a Bigram model in Python.

Code:

```
import nltk

from nltk.tokenize import word_tokenize

from nltk.util import bigrams

# Download required resource (run once)

nltk.download('punkt')

text = input("Enter a sentence: ")

words = word_tokenize(text)

bigram_list = list(bigrams(words))

print("Generated Bigrams:")

for bg in bigram_list:

    print(bg)
```

Output

```
[7] ✓ 10s from nltk.tokenize import word_tokenize
from nltk.util import bigrams

# Download required resource (run once)
nltk.download('punkt')

text = input("Enter a sentence: ")

words = word_tokenize(text)

bigram_list = list(bigrams(words))

print("Generated Bigrams:")

for bg in bigram_list:
    print(bg)
```

... [nltk_data] Downloading package punkt to /root/nltk_data...
[nltk_data] Package punkt is already up-to-date!
Enter a sentence: Natural language processing is interesting
Generated Bigrams:
(('Natural', 'language'))
(('language', 'processing'))
(('processing', 'is'))
(('is', 'interesting'))
